Abstract

Co carbonate is obtained by treating Co nitrate with K₂CO₃ at pH 8-8.2 with further filtration, washing, and drying of the ppt.

Abstract

Aq. one or more of Na, K, and NH₄ bicarbonates or of the carbonates satd. with CO₂ is stirred with an aq. inorg. acid salt of Co at a Co/CO₃ 0.3-0.5 ratio at < 40° to give pH 7.0-7.4, the ppt. is filtered, washed, and dried at 40-100°. It is used for pH adjustment of an electroplating bath or an intermediate for catalyst and salt manuf. Thus, 800 mL soln. contg. 50 g NaHCO₃ (pH 8.0) was mixed with 316 mL aq. CoCl₂ contg. 42.7 g Co/L (ratio 0.38) at 20.7 mL/min, and stirred at 800 rpm to remove CO₂ and to give pH 7.2. The sedimentation rate was 18.3 mm/min and filtration rate in a test 7.9 m³/m² h, vs. 3.8 and 4.4 when the aq. NaHCO₃ had been stirred to give pH 8.41 (5.3% decompn.). The amt. insol. in dil. AcOH was .apprx. 0.2 and 5% after prepn. or 20 days, vs. .apprx. 26% with com. one.

Abstract

An emulsion contg. a water-sol. Co(II) salt and an org. solvent is mixed with an aq. soln. of alkali metal or NH₄ bicarbonate to prep. the porous CoCO₃ spheres having av. diam. 0.1-2.0 μ and av. pore diam. 10-80 .ANG.. The spheres are used for pigments, humidity indicator pigments, catalysts for org. synthesis, and thermistors. Thus, 1M NaHCO₃ soln. was mixed with an emulsion contg. 2M CoSO₄ and 3% sorbitan monostearate-C₆H₆ soln., stirred, and filtered. The spheres had an av. diam. .apprx.6 μ and an av. pore diam. 20 .ANG..

Abstract

Co(OH)₂ was obtained by treating a Co compd. with NaOH, sepn. of the resulting ppt., washing, and drying. To lower contamination of the product and to make it possible to ppt. Co(OH)₂ at a normal temp., Co basic carbonate was used for the initial Co compd.

Abstract

In a process for prepn. of CoO by mixing and reacting of Co²⁺-ion-contg. aq. soln. and alkali aq. soln. to form Co(OH)₂, sepg. solid from liq., dewatering and roasting in vacuum, a Co²⁺-ion-contg. aq. soln. contg. Co ≤ 60 g/L is added to an agitating alkali aq. soln. at a speed ≤ 1.0 L/h, and maintaining reaction temp. at 50-60° and reaction system pH change range at ≤ 0.1 for an optional pH between 7 to 10. The Co²⁺-ion-contg. aq. soln. is CoCl₂, Co(NO₃)₂, Co acetate and/or CoSO₄. The alkali aq. soln. is NaOH, KOH, Na₂CO₃ and/or K₂CO₃.

Abstract

Small porous spherical particles (av. diam. 0.1-20 μ , av. pore diam. 10-80 .ANG.) of Co oxide (CoO, Co₃O₄) are obtained by heating spherical CoCO₃ (av. diam. 0.1-20 μ , av. pore diam. 10-80 .ANG.) or by oxidizing spherical porous Co (av. diam. 0.1-20 μ , pore diam. 10-100 .ANG.). These spherical Co oxides with almost perfect spherical shape have good flow, packing, and dispersing characteristics, and are useful as pigments, catalysts, and as raw materials in metallurgy.
